Project Title: House Prices Dataset

Project Domain:

Submission Date: 21-Nov-2025

Mentor Name: Kumaran M

Raw Dataset Link: <https://drive.google.com/file/d/1mYywxAleu1o9CKHputnj-W9y7UBFpjIR/view?usp=drivesdk>

Cleaned Dataset Link:

<https://docs.google.com/spreadsheets/d/1BLuRZHrn9JyhD28J8o-clBVvTGBhEoD4/edit?usp=drivesdk&oid=115332426149897982739&rtpof=true&sd=true>

1. Purpose of the Project

The primary purpose of this project is to conduct a comprehensive analysis of the provided housing dataset to extract meaningful insights regarding property pricing trends. The project aims to understand how various structural, geographic, and demographic factors contribute to the variability in house prices. Through systematic data examination, this report will support decision-makers, investors, and analysts in understanding the current market behaviour and future pricing projections. Ultimately, the purpose is to convert raw data into valuable insights that strengthen the accuracy and reliability of housing market evaluations.

2. Objectives of the Project

The major objectives behind carrying out this analysis include:

1. Data Understanding & Preparation

- To study the structure, completeness, and characteristics of the dataset.
- To remove inconsistencies, missing values, and outliers to ensure high data quality.

2. Exploratory Data Analysis (EDA)

- To analyze the distribution of key housing variables.
- To identify trends and patterns across different price segments.
- To examine how features such as area, location, number of rooms, and age affect pricing.

3. Feature Correlation & Insights

-
- To determine significant relationships between variables using statistical tools.
 - To highlight the strongest predictors of property value.

4. Visualization & Interpretation

- To create clear and meaningful visual representations (graphs, charts, maps).
- To translate complex numerical findings into simple, actionable interpretations.

5. Insight Generation for Business Use

- To provide data-driven insights that help developers, investors, and buyers make better decisions.
- To support pricing strategies, investment planning, and market forecasting.

6. Final Report Preparation

- To present all findings, insights, and interpretations in a professional and structured format.

3. Mission of the Project

The mission of this project is to enhance the understanding of the housing market through analytical and data-driven approaches. By utilizing statistical techniques and visual exploration, the project aims to reveal the underlying dynamics affecting property values. Our mission extends beyond basic analysis — we strive to create a reliable decision-support system that enables stakeholders to predict price movements and evaluate properties with greater confidence and accuracy.

The ultimate mission is to ensure that the dataset is transformed into a powerful resource that guides strategic planning, risk assessment, and investment optimization.

Data Cleaning in Data set

Convert the Range into Table

Data Cleaning in Data set Convert the Range into Table The entire dataset was first converted into a proper structured table/range for smooth formatting and editing by using “ctrl+t”

house_prices dataset

Ready Accessibility: Unavailable

Average: 27644.82262 Count: 2678923 Sum: 18872843953

100%

1.Price column

Problem Identified

The dataset contained missing values in the Price column, leading to data inconsistency and reduced analytical reliability.

Action Taken

The missing price fields were systematically computed and populated using an appropriate estimation formula to restore dataset completeness.

Steps Followed

Blank entries were identified, the selected formula was applied, and the updated values were validated to ensure data accuracy and uniformity.

Formula used: **=ROUND(IF(D2="0", U2 / LEFT(F2, SEARCH(" ", F2)-1), D2),0)**

Original Value		Standardized Value	
Price (in rupees) ▾ 6000 13799 17500 18824 6618 2538 10435 10000 11150 12174 11674 15995 15995 17526 11538 10000 5736 6481 11250 6731 8571 15000 12213 10940		Price (in rupees) ▾ ₹ 6,000.00 ₹ 13,799.00 ₹ 17,500.00 ₹ 4,717.00 ₹ 18,824.00 ₹ 6,618.00 ₹ 2,538.00 ₹ 10,435.00 ₹ 10,000.00 ₹ 11,150.00 ₹ 12,174.00 ₹ 11,674.00 ₹ 15,995.00 ₹ 15,995.00 ₹ 17,526.00 ₹ 11,538.00 ₹ 10,000.00 ₹ 5,736.00 ₹ 6,481.00 ₹ 11,250.00 ₹ 6,731.00 ₹ 8,571.00 ₹ 15,000.00 ₹ 12,213.00 ₹ 10,940.00

2.Carpet Area Column

Problem Identified

The dataset contained missing values in the Carpet Area column, resulting in incomplete records and limiting analysis accuracy.

Action Taken

The blank carpet area fields were calculated and updated using an appropriate formula to ensure dataset completeness and consistency.

Steps Followed

Missing entries were identified, the selected formula was applied, and the updated values were verified to maintain data accuracy.

Formula Used:

```
=IF(W2="",IFERROR(AVERAGEIF($B:$B,B2,$W:$W),G2*0.7), W2)& "

3.Super Area Column

Problem Identified

The Super Area column contained multiple blank values, resulting in incomplete data and limiting analytical accuracy.

Action Taken

The missing Super Area values were derived and populated using a structured formula supported by a helper column to ensure data completeness.

Steps Followed

Blank entries were identified, the helper-based formula was applied, and the updated results were validated for accuracy and consistency.

Formula Used: =IF(ISNUMBER(Y2),
Y2,IFERROR(AVERAGEIF(\$B:\$B,B2,\$Y:\$Y), X2*0.7))

6.Title column

Problem Identified

The Title column contained excessive and irregular spacing, leading to inconsistent text formatting and reduced data uniformity.

Action Taken

The TRIM formula was applied to remove unnecessary spaces and standardize the Title entries for consistent formatting.

Steps Followed

Irregular spacing was identified, the TRIM function was executed across the column, and the cleaned values were reviewed for accuracy and consistency.

Formula Used: **=TRIM([@Title])**

Original Value	Standardized Value

8.Floor Column

Problem Identified

The Floor column contained a significant number of missing entries, resulting in incomplete dataset records and limiting analysis accuracy.

Action Taken

The most frequently occurring floor value was identified and applied using Find and Replace to consistently populate the blank fields.

Steps Followed

Missing entries were detected, the dominant floor value was determined, and the updated records were replaced and verified for consistency.

Final Cleaned Dataset Extraction

✓ After completing all cleaning steps, only the fully cleaned dataset was selected.

✓ The cleaned dataset was copied and pasted into a new workbook for better organization and further analysis.

✓ This helped keep the final dataset separate from the raw data and ensured a clean and structured report.

Visualization using Power BI

1.Measures

1.Sum of bathroom: A new DAX measure was developed in Power BI to calculate the total number of bathrooms across the dataset.

This measure enabled accurate aggregation of bathroom counts, eliminating dependency on raw column-level values.

It enhanced data analysis by supporting dynamic filtering, visualization, and comparison across different categories.

Overall, the measure improved reporting accuracy and provided clearer insights for decision-making.

2.Count of price: A new measure was created in Power BI to count the price

3.Average of balcony: A new measure was created in Power BI to calculate the average of balcony

4.Count of the title: A new measure was created in Power BI to count of the title

2.Charts

1.Line chart: Used to analysis the count of the carpet area by title

Findings: The line chart shows that 3 BHK has the highest carpet area count, while Builder Floor has the lowest.

2. Pie Chart: Used to analysis count of the price by title

Findings: The pie chart indicates that 3 BHK has the highest count of price, whereas 5 BHK shows the lowest.

3. Stacked Bar Chart: Used to analysis sum of the price by location and title

Findings: The stacked bar chart shows that New Delhi has the highest sum of price, while Noida has the lowest.

6. Funnel Chart: Used to analysis the sum of the price by location

Findings: Based on the funnel chart, the *Sum of Price by Location* is highest in New Delhi, while Noida shows the lowest price contribution among all locations.

7. Waterfall Chart: Used to analysis the count of the price by ownership and furnishing

Findings: Freehold–Furnished has the highest price count, while Leasehold and Power of Attorney show very low values. This means most prices come from Freehold properties, especially furnished ones.

8.Add Slicers for:

- 1.Title
- 2.Ownership
- 3.Furnishing

Dashboard After using Slicer

Applied slicer in Title-1BHK

Insights

1. 3 BHK units dominate the dataset, contributing the highest count and price share, while higher configurations like 8–10 BHK occur rarely and show steep drop-offs.
2. New Delhi and Gurgaon record the highest total property prices, indicating premium market concentration compared to other cities like Chennai and Ahmedabad.
3. Furnished and Semi-Furnished properties show higher price contribution, suggesting furnishing level plays a strong role in pricing and buyer preference.
4. Ownership is primarily Freehold, indicating greater demand and availability for fully owned properties over leasehold and other categories.
5. Balcony average remains low at 2, showing a standard feature across most listings with limited variation across property types.
6. Price distribution by location shows significant spikes, highlighting a few high-value transactions that heavily influence total price figures.
7. Bathroom count total of 455K reflects strong data volume, supporting accurate aggregation and trend interpretation across categories.

Conclusion

This dashboard provides a clear overview of housing market patterns, showing that 3 BHK units, Freehold ownership, and major metro locations drive most price contributions. Furnishing level significantly influences pricing, while balcony and configuration patterns remain largely consistent across the dataset. Overall, the analysis supports data-driven decision-making for pricing strategy, market targeting, and property feature prioritization.
